Infrastructure & Scaling — Scope of Work

Addendum for inclusion in the final platform proposal.

Objective: move the platform off its current shared/basic hosting onto infrastructure sized for 2,000+ active users per day, with headroom for continued growth, while keeping AI photo processing reliable under concurrent load. The options below were evaluated against Hostinger, Contabo, AWS Lightsail, DigitalOcean, and Google Cloud Storage; the recommended combination gives the best balance of performance, capacity, and cost for the current requirement.

1 · Production Server Upgrade

RECOMMENDED

Hostinger — KVM 4

4 vCPU · 16 GB RAM · 200 GB NVMe SSD

Comfortably covers the 2,000+ users/day target with headroom; rated for 5,000–10,000 users/day, so no re-upgrade is needed as adoption ramps up over the next phase.

₹2,948.82

per month

2 · Cloud Photo Storage

RECOMMENDED

Google Cloud Storage — 250 GB tier

Stores original donor photos, AI-styled images, and white-background cutouts

Pay-as-you-go object storage; 250 GB comfortably holds the photo volume expected at this user scale, with the ability to grow tier-by-tier as the catalog expands.

~\$5

per month (USD, GCP
billing)

3 · Gemini API — Paid Billing Tier

RECOMMENDED

Upgrade Gemini API key to paid (pay-as-you-go) billing

Currently running on a free-tier key, which caps request volume and causes throttling (HTTP 429) under concurrent photo-processing load

Moving to the paid tier removes the free-tier request cap so AI photo processing (styled image + cutout per item) stays reliable as daily drops scale up. Cost is usage-based and scales with activity — roughly ₹80–840/month at 10,000 monthly active users, and proportionally lower at the current scale.

Usage-based

pay-as-you-go

Estimated fixed monthly infrastructure cost: ₹2,948.82 (server) + ~\$5 (storage) — Gemini usage billed on top, scaling with actual activity.

Figures above are planning estimates based on published provider pricing at the time of review; actual usage-based costs (storage, Gemini) depend on real traffic, image volume, and caching. If traffic grows meaningfully beyond this scale, the same providers offer a direct upgrade path (e.g. Hostinger KVM 8, higher GCS tiers) without a platform migration.
